now i have just moved to a new apartment, and decided to take everything out of the box. at first i could not get it to work. only half a minute to a minute of recording. tried it on a different hdmi port and that didnt work either. now it is working great, so im happy. but would really like to understand the full capabilities. how does it decide where to crop to, for example, what will it crop to if i send a 1080p signal to a 1080p tv? and does it automatically scale the image? if so, why? if it does not, what can i do to get this to work? finally got the dual splitter working, it took 4 hours of banging around with wires and trying various cable options and the original network cable. my tv was set to 1080p and i was getting a green screen with a download bar on the top and bottom. the first cable i tried was that nasty looking lnext one that everyone has been posting on youtube. i know how to use this cable. i have only seen it fail before but thought the last time it happened was because it was too long. well i tried a shorter one and it worked. i tried a second one of the same length and it worked. i tried a shorter one and it worked. i tried a third and it didnt work. i was thinking it must be the length of the cable. i tried the same cable again and it worked. all four of these cables were exactly the same length and one of them worked and the other three didnt. obviously there is something i am missing. so how long should the cable be? what should it look like? i tried one with no wire and it worked. i tried the one with no wire, but connected to another splitter and it didnt work. i tried the one with no wire, but connected to a video source and it worked. i tried the one with no wire, but connected to a video

---

source and it didnt work. so i think there is something with the splitter. how long should the cable be? what should it look like?

From our Lab, we are going to capture some video using the USB video capture device. We plugged this into my Win10 machine and started up a recording using MIO SHD. I have to say, this is one of the easiest recording setups I've ever used. I was in and out of the house, just sitting on the couch watching some TV to monitor the recording in full HD 1080p, with a good antenna in the other room, and it was all done on a single monitor, all with just a few clicks. In many cases where you find an HDTV to computer adapter, you'll have to run a capture card, use two monitors or some other configuration that would be difficult to set up and then manage on a single machine. I like that. I need an HDMI grabber. Does anyone have a recommended one? I want to use it to capture the tv. I have a line out from my tv for the hdmi out. I want to plug the hdmi grabber into the tv and then plug the HDMI output from the grabber into my new computer. I want to make a copy of the tv and send it to my pc. Perhaps I can use a vga cable and plug the tv out into my computer. What do you think? I need a 1080HDMI HDMI splitter with HDMI input available. I want to connect the cable box and have a high quality source on my other computer, with an HDMI input. I am using a mostly full size Apple monitor (20.1) and I can't use my 20 inch diagonal USB display, which is why I need a HDMI Splitter. I only want to use it for recording TV on this PC. I bought copy protect about a month ago and it works great. I bought the full version and I love it. Its amazing

---

and makes printing easier. I set it up and if someone does not use it correctly it will give a reminder message about it. 5ec8ef588b
